Final Site Requirement Project Report

Name of the Website Project: Psychologypedia

Submitted by:

Name: Shivani Giri

Student ID: 25068614

Section: C

Submission Date: 2026/04/18

1. Introduction

Psychologypedia is an educational website designed to simplify psychology concepts for students. The website presents information in a clear, structured, and visually engaging way using HTML, CSS, and JavaScript.

The main goal of this website is to make psychology easier for students to understand through simple explanations and visuals.

2. Objectives

- To create an educational psychology learning platform
- To design a user-friendly and responsive website
- To apply HTML, CSS, and JavaScript knowledge
- To implement interactive features like gallery popup and topic navigation
- To improve web design and usability skills

3. Website Structure (Site Map)

The website consists of 5 main pages:

- index.html (Home)
- about.html (About)
- topics.html (Psychology Topics)
- gallery.html (Image Gallery)
- contact.html (Contact Form)

All pages are interconnected using a consistent navigation bar.

4. Wireframes

The website design was planned using wireframes before development. These wireframes helped in organizing the layout of each and ensured a consistent structure across the entire website.

Wireframe Pages:

1. Homepage (index.html)
2. About page (about.html)
3. Topics page (topics.html)
4. Gallery page (gallery.html)
5. Contact page (contact.html)

Each wireframe includes:

- Header with navigation
- Main content area
- Footer section

Home Page Wireframe (index.html)

The homepage wireframe shows the main landing page of the website. It includes a navigation bar at the top, a hero section with an image slider, featured psychology topics, and additional sections like gallery preview and newsletter.

This layout was designed to immediately attract users and guide them toward exploring different psychology topics easily.

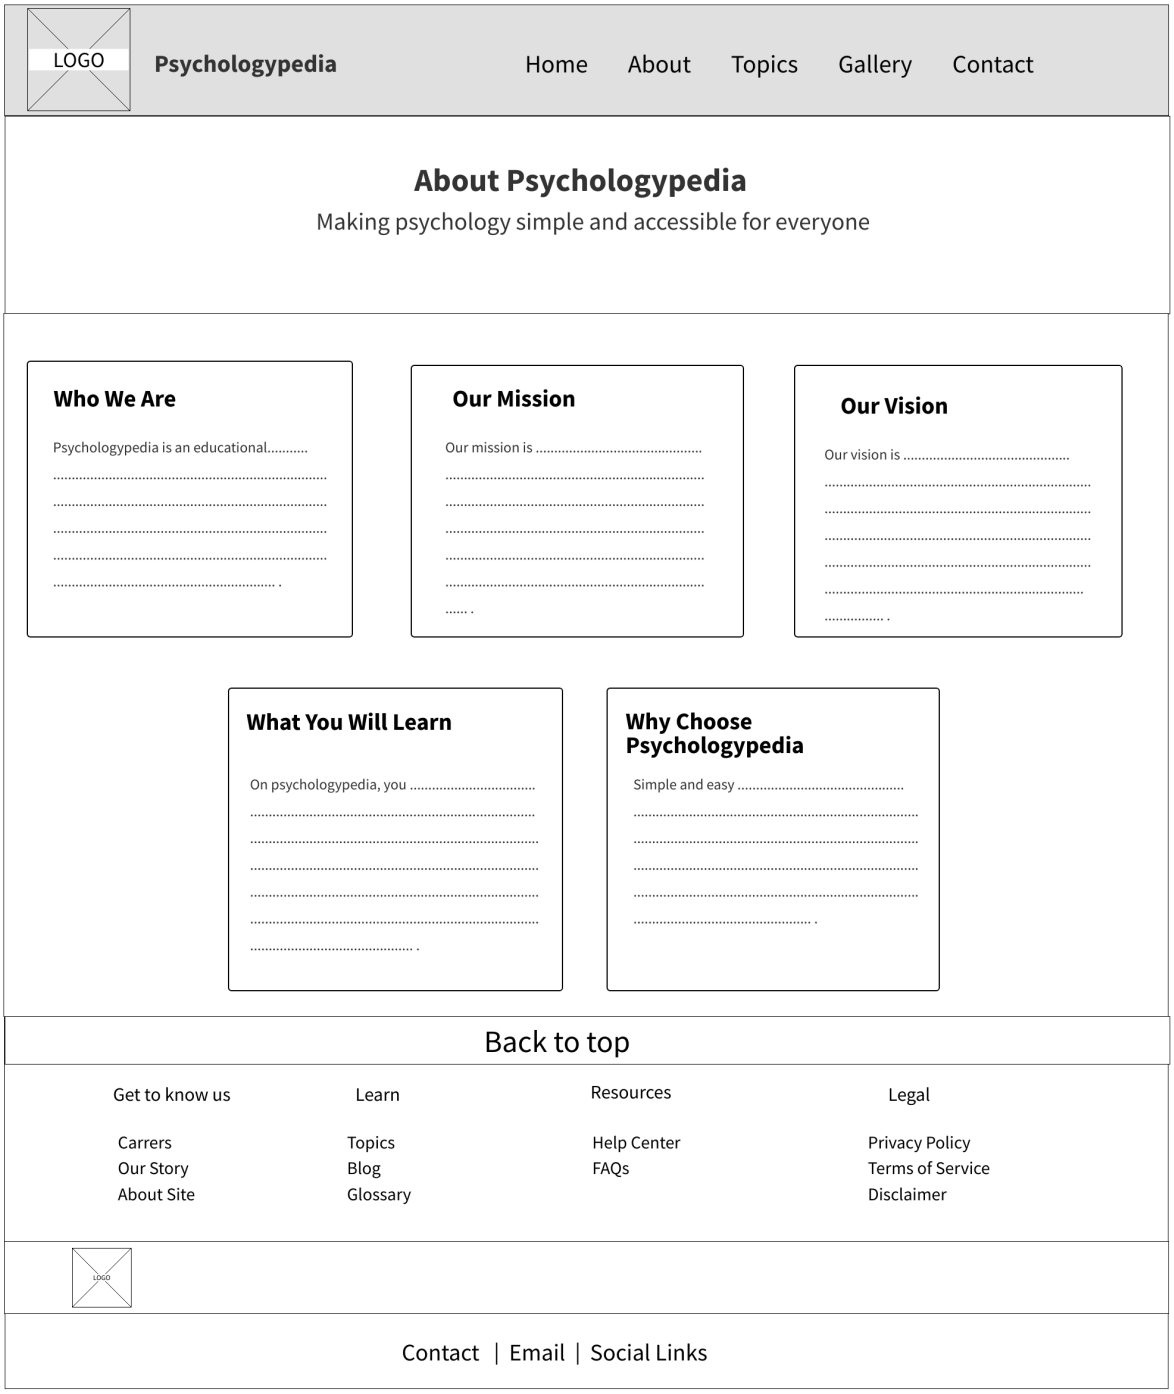
About Page Wireframe (about.html)

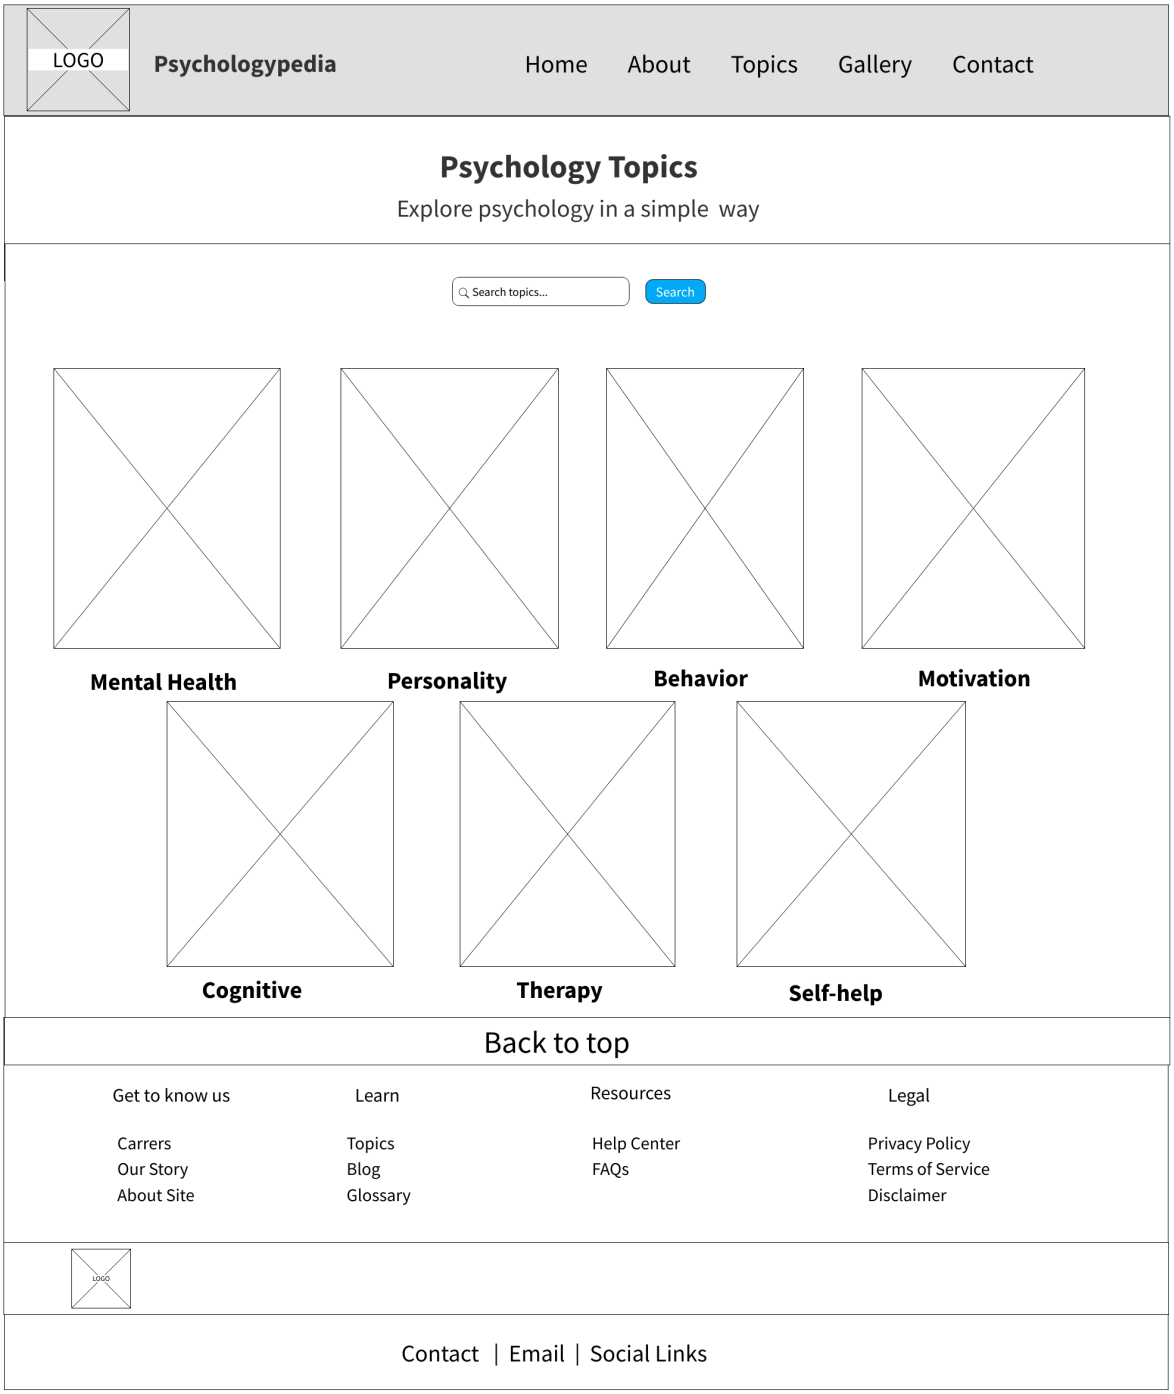
The about page wireframe is quite simple and clean. It starts with a header section and then contains different content boxes.

These boxes explain what Psychologypedia is, its mission, vision, and what users can learn from the website. The idea was to keep the information easy to read and well organized.



Topics Page Wireframe (topics.html)

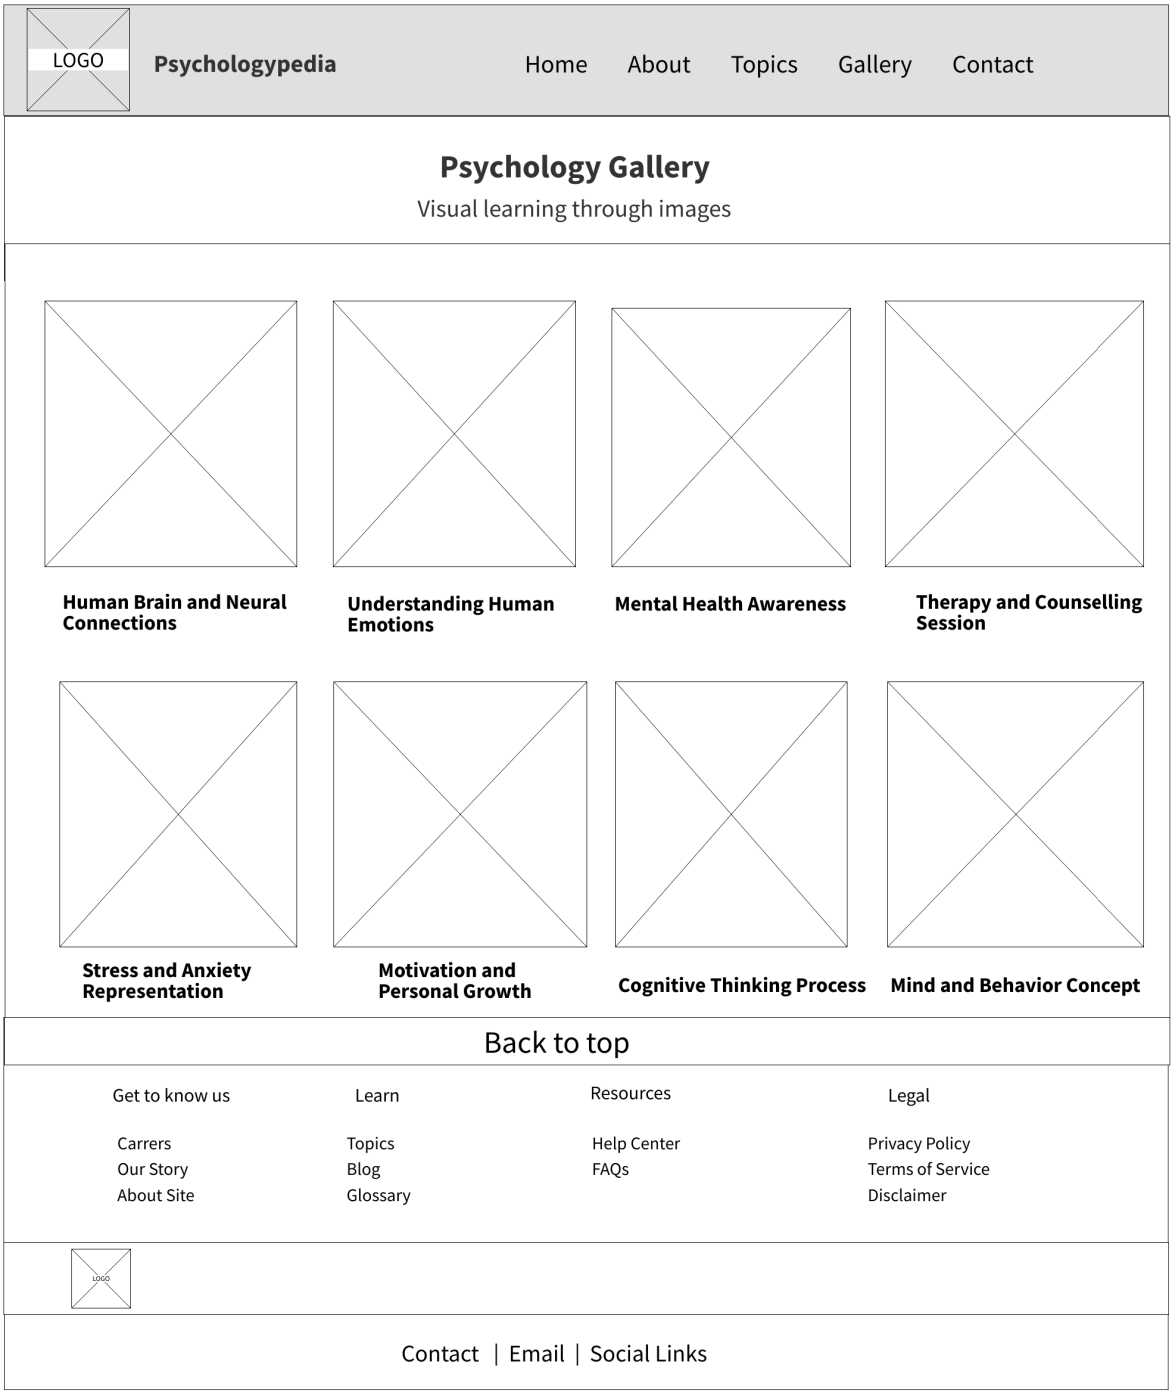
The topics page wireframe includes a search bar at the top topic cards. When a topic is selected, its content is shown in a separate section with next and previous buttons for easy navigation.



Gallery Page Wireframe (gallery.html)

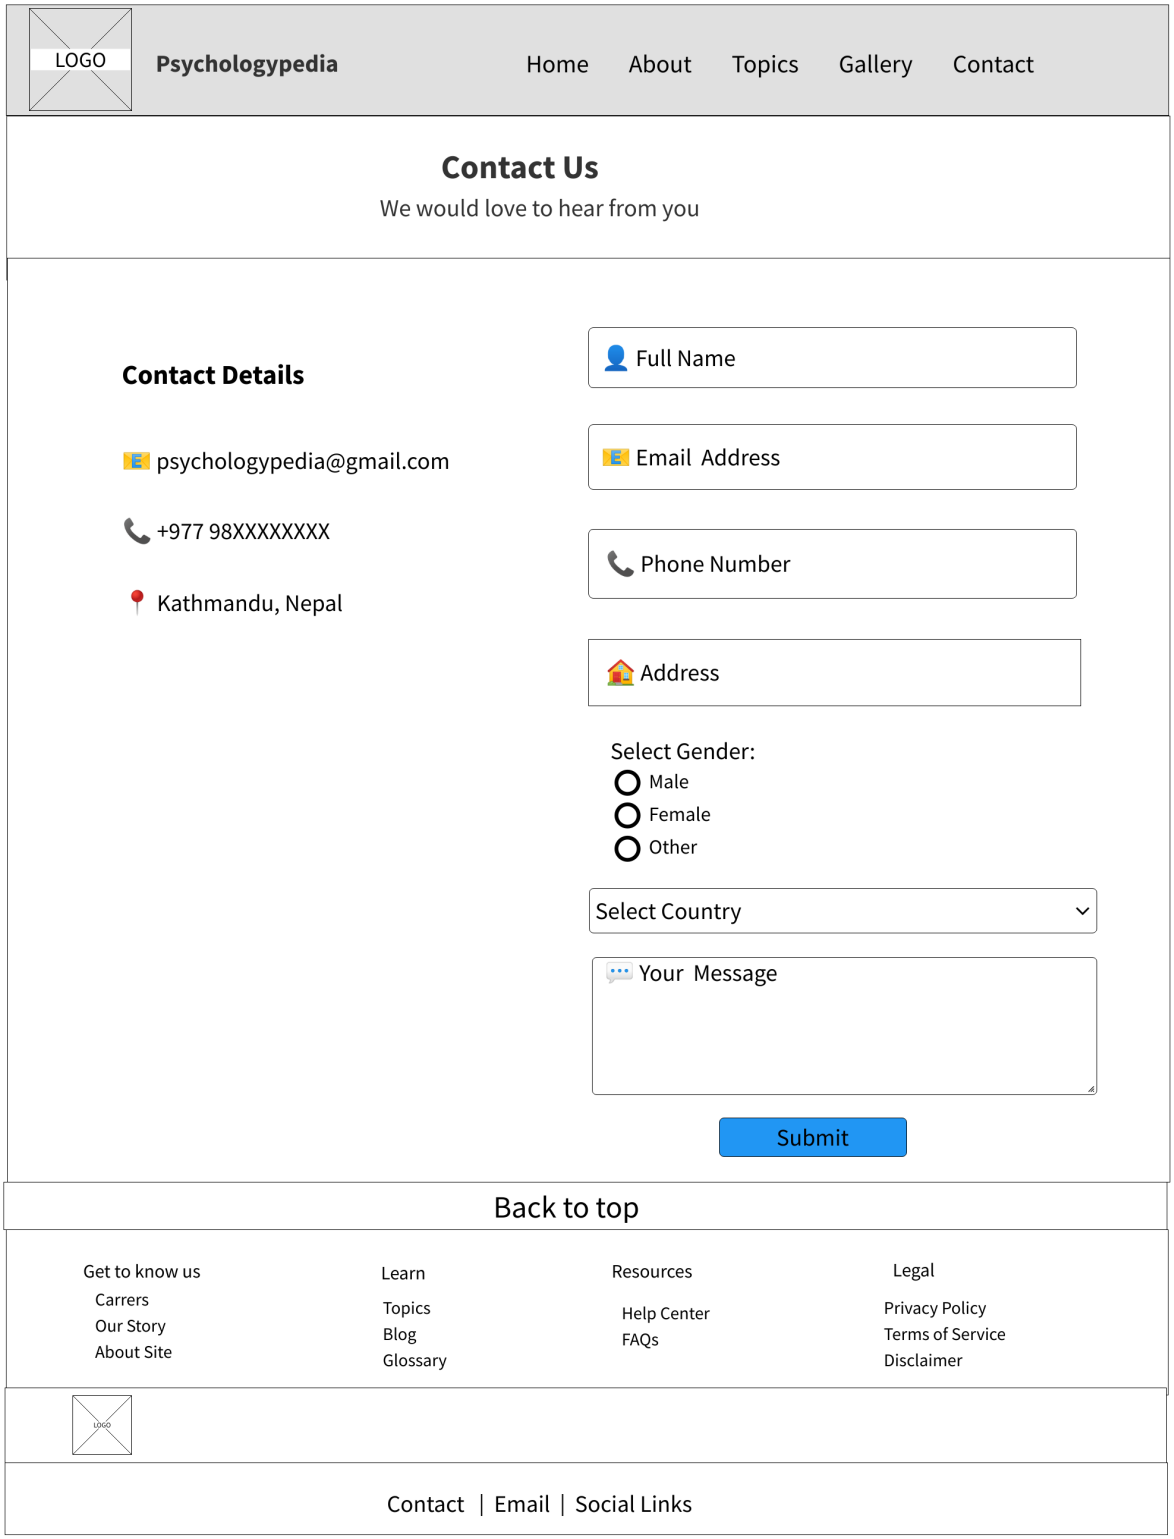
The gallery wireframe is designed as a grid of images. Each image represents a psychology-related concept.

I also included a popup feature in the design so that when a user clicks on an image, it opens in a larger view. This makes the gallery more interactive and visually engaging.



Contact Page Wireframe (contact.html)

The contact page wireframe includes a form with fields like name, email, phone number, address, gender, country and message box. It also shows contact details for direct communication.



5. Design Decisions

The website is designed with a simple and modern layout so that users can easily focus on learning psychology concepts without distraction.

- Dark and blue-themed colour scheme for professionalism
- Consistent navigation bar on all pages
- Card-based layout for topics and gallery
- Responsive layout using flexbox
- Clear font styling for readability

6. Features Implemented

The website includes several interactive features to improve user experience and make learning more engaging.

Home Page

- Image banner with call-to-action
- Featured psychology topics
- Gallery preview
- Newsletter section

Topics Page

- Interactive topic cards
- Search functionality
- Next/Previous navigation using JavaScript

Gallery Page

- Image grid layout
- Popup image viewer
- Slideshow navigation (next/previous)

Contact Page

- Form with validation using JavaScript
- Pop-up success/error messages
- Loader animation during submission

7. Navigation System

The website includes:

- Persistent navigation bar (all pages)
- Footer navigation links
- Internal page linking system

This ensures users can access any page easily from any location.

8. Usability Features

- Clear and readable font sizes
- Good colour contrast
- Organized layout structure
- Smooth scrolling and navigation
- Interactive elements for better engagement

9. Technologies Used

- HTML5
- CSS
- JavaScript (ES6)
- Flexbox layout system

  This website was developed using HTML5 for structure, CSS3 for styling, and JavaScript (ES6) for interactivity. Flexbox was used to create responsive and flexible layouts.

10. Accessibility Features

The website includes several accessibility considerations:

- Alternative text (alt attributes) for images
- High contrast colour scheme for readability
- Simple and readable font styles
- Consistent navigation structure across pages
- Semantic HTML structure (header, nav, section, footer)

These features help improve usability for users with different needs.

11. Internet Technologies and Security (LO1)

Psychologypedia works using basic internet technologies that allow the website to run properly in a browser.

The website uses HTTP (HyperText Transfer Protocol), which is what helps web pages load and communicate between the browser and server. In real websites, HTTPS is used instead because it is more secure and protects data by encrypting it.

Another important part of the internet is the DNS (Domain Name System). This system changes website names into IP addresses so users can easily access websites without needing to remember numbers.

The website is built top work on common browsers like Chrome, Edge, and Firefox. These browsers read and display the HTML, CSS, and JavaScript code.

For security, I used JavaScript form validation in the contact form. This helps make sure users enter correct information before submitting the form. Even though this website does not store personal data, validation helps prevent errors and improves user experience. In real websites, HTTPS would be important to keep user data safe.

12. SEO and Metadata

Search Engine Optimization (SEO) helps websites appear in search engine results.

In Psychologypedia:

- Each page includes proper heading structure (H1, H2, H3)
- Clear and descriptive page titles are used
- Content is organized using semantic HTML elements
- The website structure supports search engine indexing

Meta tags such as title and description help improve visibility and user understanding of each page.

13. Responsive Design

The website uses Flexbox to create flexible layouts that adjust to different screen sizes.

However, full responsiveness is still limited:

- Desktop layout works correctly
- Tablet layout is partially responsive
- Mobile layout needs improvement

Media queries were not fully implemented, which is an area for future enhancement.

14. Website Evaluation (LO2)

Overall, I think the Psychologypedia website turned out quite well and meets its main purpose of helping students learn psychology in a simple way.

One of the best things about the website is its clean and simple layout, which makes it easy to navigate. I used a **card-based design**, which helps organize information in a clear and visually appealing way. The interactive features like image popups, topic navigation, and form validation make the website more engaging for users.

However, there are still some areas that could be improved. The website is not fully responsive on smaller mobile screens, which affects usability on phones. Also, the JavaScript features are quite basic and could be improved further to make the website more interactive.

In the future, I would like to improve the responsiveness using media queries and add more advanced features like quizzes or interactive learning tools. I would also improve the design to make it look modern and accessible.

15. Reflection

This project helped me understand how HTML, CSS, and JavaScript work together to build a complete website. Before this, I could only write basic code, but now I understand how different parts connect to create a functional site.

One of the challenges I faced was working with JavaScript, especially for things like image popups and navigation between topics. At first, it was confusing, but after practicing and fixing errors, I was able to make it work.

Another challenge was keeping the design consistent across all pages. I learned that planning the layout using wireframes before coding is really helpful because it gives a clear structure to follow.

If I had more time, I would improve the mobile version of the website and add more interactive features like quizzes or user feedback sections. Overall, I feel this project really improved my confidence in web development.

16. Testing

I tested the website on different browsers like Safari, Google Chrome, and Brave to make sure everything works properly. The layout and features worked well on all of them.

I also tested all the links and navigation to make sure users can move between pages without any issues. The contact form was tested to ensure the validation works correctly and does not allow empty submissions.

JavaScript features responsiveness, the website worked well on desktop and tablet screens, but I noticed that it needs improvement on smaller mobile screens. Some small issues like spacing differences in the gallery and slight layout shifts on mobile devices were also found. These can be improved in future updates.

17. Folder Structure

/Psychologypedia

- index.html
- about.html
- topics.html
- gallery.html
- contact.html
- sitemap.html
- table.html

/css

- style.css

/js

- scripts.js
- about.js
- topics.js
- gallery.js
- contact.js

/images

18. Future Improvement

- Improve mobile responsiveness using media queries
- Add interactive quizzes for learning psychology
- Includes user login system
- Connect website to a backend database
- Improve JavaScript functionality for better interactivity

19. Challenges Faced

- Managing JavaScript interactions across multiple pages
- Ensuring consistent design across all pages
- Implementing image popup and navigation logic
- Handling form validation

20. Conclusion

Overall, building the Psychologypedia website helped me understand how HTML, CSS, and JavaScript work together to create a functional and interactive website. It also improved my design and problem-solving skills.
